

TIGER SHARK

Galeocerdo cuvier

- Tiger sharks like to eat lots of different things including fish, turtles, marine mammals and sometimes sea birds
- Tiger sharks can grow to almost 18 ft long
- Tiger sharks get their name from the dark vertical stripes on their sides that lighten and fade as they get older

FUN FACT: Tiger sharks can protect seagrass beds because they keep the species that graze on the grass in low numbers so that the beds stay healthy!
